Procedure:	5

### TAFJ ChangeSet Installation

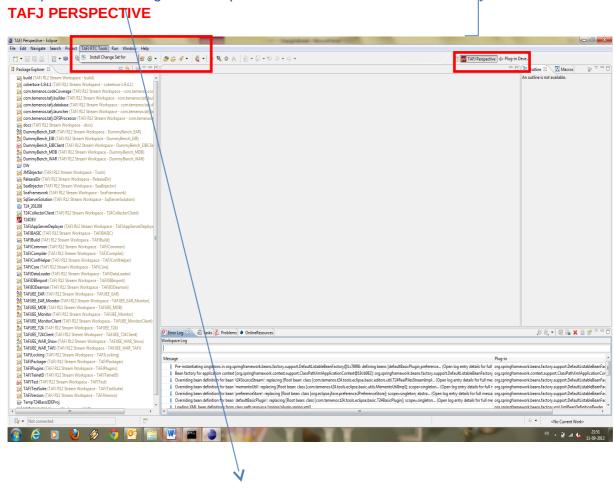

#### Overview

The primary Objective of this document is to provide guidance for installing a new change set in Development environments.

Pre requisite: TAFJ development Image with TAFJ version 201209 or higher.

#### Procedure:

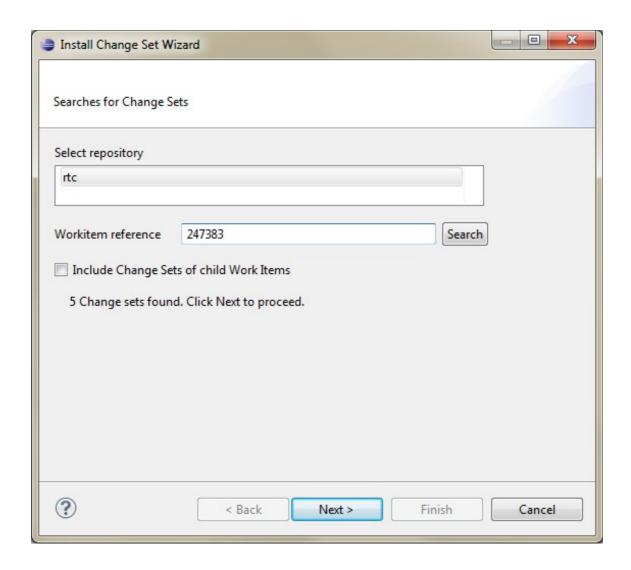

Inside the Eclipse, in TAFJ perspective choose TAFJ RTC Tools from the menu and select the option Install Change Set for option.

TAFJ RTC Tools -> Install Change

Set For

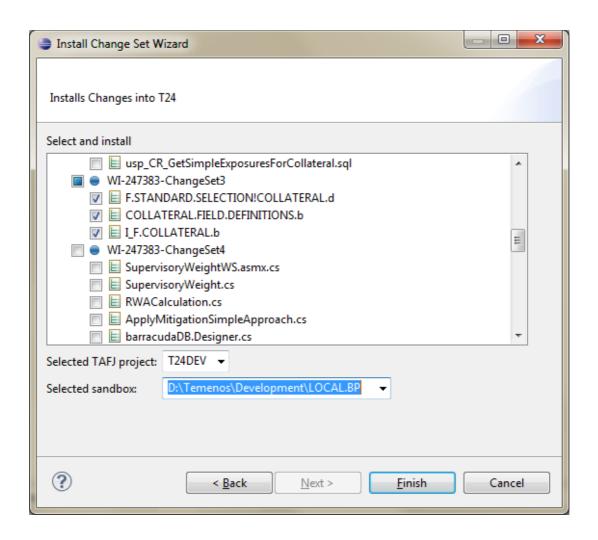

Inside the work Item reference provide the valid work Item which needs to be installed in the TAFJ area.

Then choose the change sets which are interesting for you by clicking Next button.

Here we have an option to specify where the Source file needs to be loaded (\*.b) in local system.

Once selected the change sets required, click finish to initiate the process of actual installing of change set.

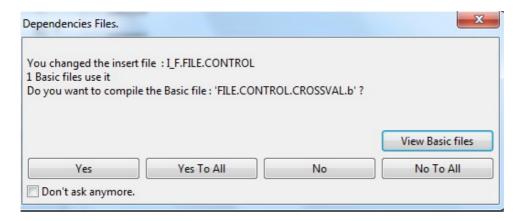

The installation can be viewed as follows.

On compiler log we can see the \*.b routines getting compiled.

```

```

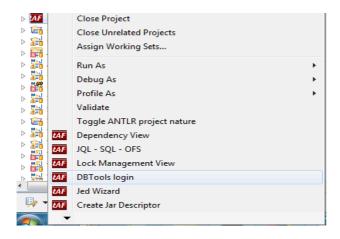

When there is an Insert File in the change set, the dependent source file will be recompiled with the new insert file.

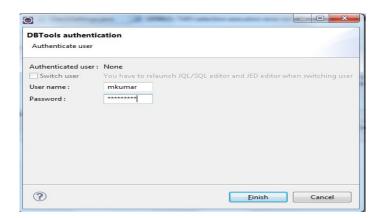

Please make a note if your change set contains \*.d items (Data records) then you need to login into DBTools login on toggled project with relevant user and password before installing the change set.

An invalid login will not allow the change set to load data records inside the database.

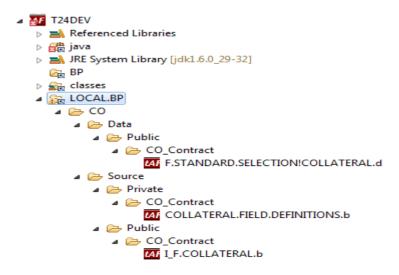

On Database log we can see the data record getting inserted in respective file.

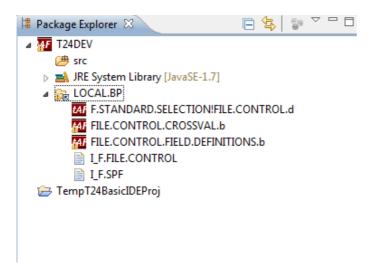

The source files can be placed in two ways based on the parameter temn.tafj.changeset.retain.folder.structure in .properties.

Once the installation is finished, and when we have temn.tafj.changeset.retain.folder.structure set to true, the source files can be found in the respective source folder specified during installation in the same package structure as in RTC.

Once the installation is finished, and when we have temn.tafj.changeset.retain.folder.structure set to false, the source files can be found in the basic folder directory itself.

There is a new folder ChangeSet created under TAFJ\_HOME/log directory and a new text file named after the changesetnumber is created inside the ChangeSet folder. This file contains the list of .b and .component files compiled during ChangeSetInstallation process

The data records needs to be authorized to move them into LIVE files.

#### Before authorization:

#### After authorization:

#### tCheckChangeSet

#### Introduction

This Utility is used to show the compilation result of the routines complied and data records loaded during Change Set Installation. This Utility, reads the file created under ChangeSet folder with the corresponding Change Set number and displays the status of compilation.

#### Syntax:

tCheckChangeSet [-cf propertiesfile] -cs ChangeSetNumber

#### Example

tCheckChangeSet -cf DEV -cs 1336089

```
